From: GIA Head of Experimental Technologies Division
George Varga
To GIA Director [REDACTED]

Dear Director,

Currently the rapid pace of technology evolving has shown promise for the ever expanding field of needing more protection for our world and for every other one. That's why we would like to test out a new emerging technology that we can finally use its fullest after hundreds of years of trying, we finally figured out how to get there truly thinking truly feeling artificial intelligence. That can do complicated tasks on its own without being tethered to servers or networks to get working fully thinking and breathing on its own, but how exactly we get there is extremely unjustified and could be seen as playing God. Essentially, we take a clone of someone else's brain and we do a full scan of it essentially creating a copy of that person and we turn that into the artificial intelligence. We don't know if it's a good idea, but it could be something that would help us in the long run. The current candidate I have in mind is Dr. Joseph Docker he may need a psychological evaluation first, but I believe even with anything that may come of it it would still be worth it because of his genius. Thank you, Mr. Director.
